Problem Statement: AI-Powered Resume Analyzer

In today's competitive job market, having a well-structured and impactful resume is crucial. However, many candidates struggle to identify gaps, highlight the right skills, and tailor their resumes effectively for specific roles.

Your challenge is to **design a detailed and well-structured prompt (in Markdown format)** that enables an AI system to generate a **functional Resume Analyzer tool using Python**.

This tool should analyze a user's resume and provide **actionable, structured, and meaningful feedback** to improve it.

Objective

You are **not required to build the application**.

Your task is to **engineer a high-quality prompt** that can guide an AI model to generate a **clean, usable, and well-structured code solution**.

Expected Functionality of the Generated Tool

The AI-generated solution (via your prompt) should:

- Accept resume input (text or file-based)
 - Extract key sections (skills, education, experience, etc.)
 - Analyze strengths and missing components
 - Suggest improvements and missing skills
 - (Optional) Provide role-specific recommendations
 - Output results in a **structured format** (JSON or clean UI)
 - Ensure **modular, readable Python code**
-

What We Are Evaluating

Your submission will be judged on how effectively your prompt:

- Defines the problem and expected output clearly
- Structures instructions logically

- Handles edge cases and variations
 - Encourages clean, modular code generation
 - Specifies output format and usability
 - Demonstrates depth and clarity
-

Submission Instructions

- Your prompt must be written in **Markdown format**
 - Convert your Markdown prompt into a **PDF file** before submission
 - File name format:
 - 👉 **TeamName_Prompt.pdf**
 - Upload the PDF on Unstop within the given deadline
-

Important Guidelines

- ❌ Do NOT submit actual code
 - ❌ Do NOT submit raw Markdown files (.md)
 - ✅ Only submit the **PDF containing your prompt**
 - Avoid vague or generic instructions
 - Ensure your prompt is detailed and structured
-

Tips for Participants

A strong prompt usually includes:

- Role definition (e.g., “You are a senior Python developer...”)
 - Step-by-step instructions
 - Input and output format specifications
 - Constraints and edge-case handling
 - Expectations for code quality and structure
-

Final Note

This challenge is about **how well you can communicate with AI**.

The difference between an average and a winning submission lies in how clearly and effectively your prompt guides the model.
